IP46 Protection

Ingress Protection (IP) levels are a classification system that assesses the degree of protection of equipment against the ingress of solids and liquids. This system is made up of two digits: the first indicates resistance against the penetration of solid objects and the second refers to protection against liquids.

In the case of the Wall Clock Nature, its protection level is IP46. The digit 4 means that this device is protected against the ingress of solid objects with a diameter of more than 1 mm. The digit 6 indicates that this device is resistant to powerful jets of water coming from any direction. Thus, this watch offers good protection against dust and high water resistance.
